## Research Interests

I am an ecologist broadly interested in the processes that determine the assembly, diversity, and dynamics of ecological communities from local to global scales. My research explores how the drivers of community assembly—species pools, dispersal, ecological niches, and ecological drift—shape patterns of biodiversity at different spatial scales and responses of biodiversity to environmental change. I explore these questions using large-scale and long-term observational studies, field experiments, and ecological synthesis in a variety of plant communities spanning temperate and tropical forests, ecosystems shaped by natural and human-altered disturbances, and global hotspots of plant diversity. Current research topics include: community assembly, biotic interactions (plant competition, plant-enemy & plant-mutualist interactions), and plant chemical community ecology across ecological and biogeographic gradients; plant functional diversity as a driver of community assembly; forest diversity and dynamics across temperate and tropical ecosystems; biodiversity responses to fire disturbance; ecological drivers of biodiversity-ecosystem functioning relationships across spatial scales; and the evolutionary assembly of regional biotas.
